

Satellite Distribution

Distribution of short and long form audio via satellite

Fairfax Radio Syndication is Australia's leading audio distributor to the commercial radio industry.

We use the most advanced, secure satellite transmission via Optus D2 on a high powered national beam transponder.

The satellite is in a geo-stationary orbit, 36,000 kilometres above the Solomon Islands; the "footprint" includes Australia and New Zealand. Any programme of any duration can be delivered live or pre-recorded, simultaneously, to every commercial radio station in Australia, or securely to only a few stations.

This service is available to interested parties wishing to distribute audio to the Australian Commercial Radio Industry.
